Procedure to Run Code:

For .ipynb: Run the 3 cells one by one, each cell represents one of the steps Shingling, Minhashing, LSH respectively.

-> Explicit printing of output of each step is not done, but for the user's ease of evaluating the model each of these step's print statements are commented out and can be used.

For .py: Run the code in the terminal and give relevant input asked.

-> Explicit printing of output of each step is not done, but for the user's ease of evaluating the model each of these step's print statements are commented out and can be used.
